

Amendments to the Claims:

1. (Cancelled)

2. (Currently Amended) An emergency response system for summoning an emergency responder and for routing said responder to a victim, said system comprising:

- a central station for actuating a remote emergency response device by transmitting a trigger signal to said device upon a signaling of a victim in a vicinity of said emergency response device, wherein said trigger signal comprises position information of the victim; and

- an actuatable emergency response device comprising:

- a communication means arranged unit configured to activate a signaling ~~means~~ unit upon receipt of the trigger signal;

- the signaling means arranged unit configured to broadcast a message for summoning an emergency responder to the victim;

- a navigation means arranged unit configured to determine a routing of the emergency responder to the victim based on the position information of the victim and position information of the emergency response device, the navigation unit being activated in response to detecting an action of the emergency responder on the emergency response device; and

- a user interface arranged to feed back the routing to the emergency responder; ~~and~~

- ~~- a detection means arranged to activate the navigation means upon detection of an interaction with the emergency response device.~~

3. (Previously Presented) The system according to Claim 2, wherein the emergency response device comprises an automatic external defibrillator.

4. (Currently Amended) An emergency response device for summoning an emergency responder and for routing said responder to a victim upon receipt of a trigger signal indicating position information of the victim, said emergency response device comprising:

- a communication unit configured to receive the trigger signal and to activate a signaling unit upon receipt of the trigger signal;
- the signaling unit configured to broadcast a message for summoning an emergency responder to the victim;
- a navigation unit configured to determine a routing of the emergency responder to the victim based on the position information of the victim and position information of the emergency response device;
- a user interface configured to feed back the routing to the emergency responder; and

a detector ~~arranged to activate~~ which activates the navigation unit ~~upon in response to detection of an interaction between~~ detecting the emergency responder ~~[[and]]~~ interacting with the emergency response device.

5. (Cancelled)

6. (Previously Presented) The device according to Claim 4, wherein the communication unit is configured to communicate by wireless telecommunication.

7. (Previously Presented) The device according to Claim 4, wherein the communication unit is configured to communicate by wired telecommunication, said wired telecommunication comprising at least one of a computer modem or a fixed line telephone unit.

8. (Previously Presented) The device according to Claim 4, wherein the signaling unit wireless communication unit configured to contact all wireless communication units located in a vicinity of the wireless communication.

9. (Previously Presented) The device according to Claim 4, wherein the signaling unit loud speaker configured for broadcasting a verbal message.

10. (Previously Presented) The device according to claim 4, wherein the device comprises an automated external defibrillator.

11. (Currently Amended) A method for summoning an emergency responder and for routing said responder to a victim, said method comprising the steps of:

- providing an actuatable emergency response device;
- actuating the emergency response device by transmitting a trigger signal to the emergency response device, said trigger signal comprising position information of the victim;
- broadcasting a message by a signaling unit of the emergency response device for summoning an emergency responder in a vicinity of the emergency response device;
- activating a navigation unit of the emergency response device ~~upon~~ in response to detection of detecting an interaction between the emergency responder and the emergency response device;
- determining a routing of the emergency responder to the victim with the navigation unit of the emergency response device;
- providing feedback of the routing to the emergency responder on a user interface of the emergency response device.

12. (Cancelled)

13. (Previously Presented) The method according to Claim 11, wherein the emergency response device is an automated external defibrillator.

14. (Previously Presented) The system according to claim 2, wherein central station comprises a look-up table of pre-stored position information of publicly available actuatable emergency response devices and is configured to automatically transmit the trigger signal to a selected emergency response device.

15. (Previously Presented) The system according to claim 14, wherein the selection of emergency response devices is based on a comparison

between the pre-stored position information of the available emergency response device and the position information of the victim.

16. (Previously Presented) The system according to claim 2, wherein the user interface comprises a display configured to project the routing instructions and a map of the routing instructions.

17. (Previously Presented) The system according to claim 2, wherein the user interface comprises a display configured to project instructions to guide the emergency responder through steps of delivering a defibrillation shock.

18. (Previously Presented) The device according to claim 4, wherein the navigation unit stores a floor plan of at least a portion of a building in which the emergency response device is located and the user interface displays at least a portion of the floor plan as part of the routing fed back to the emergency responder.

19. (Previously Presented) The device according to claim 4, wherein the detector comprises a movement detector configured to detect when the emergency response device is picked up by the emergency responder.

20. (Previously Presented) The device according to claim 4, wherein the detector comprises a release clutch configured to detect when the emergency response device is removed from its dwell location by the emergency responder.
